Title: Emerald Under-gloves dramatically improve protection from cytotoxic agents.

Research suggests that under-gloving dramatically reduces breakthrough rate and offers enhanced protection from chemotherapy and other hazardous chemicals.

Whatever glove you are using for handling cytotoxic agents, wearing a BioClean Emerald glove as an under-glove gives you the peace of mind of having in excess of 7 hours breakthrough time for cytotoxics.

The Emerald gloves are thin and smooth to easily slide under any other glove and are latex free, eliminating type 1 latex allergies.

BioClean Emerald gloves are available in a range of sizes and the supersoft formulation offers enhanced comfort and fit.

If you would like to try the gloves in your unit, then please contact Helapet on **0800 0328 428** for more information and **FREE SAMPLES**.
